

Power and Receptacle Requirements for The Watercannon 1.5

Each facility must have a dedicated 20 amp 120 volt circuit run in close proximity to the Watercannon. This line must be run by a licensed electrician and must follow local and National electric codes. You will need to purchase one NEMA 5-20R receptacle if you do not have one.

Each Watercannon 1.5 comes with a 20 amp 120 volt cord with a built in GFCI. The cord is 10 gauge 3 wire (10/3) yellow safety cord. The GFCI has a test and a manual reset button. The response time of the GFCI is 25 milliseconds (mS)
