

Power and Receptacle Requirements for The Watercannon 3.0

Each facility must have a dedicated 20 amp 240 volt circuit run in close proximity to the Watercannon. This line must be run by a licensed electrician and must follow local and National electric codes. A water tight flip style receptacle and box will ship with each Watercannon. If needed, we can ship this receptacle in advance.

Each Watercannon 3.0 comes with a 20 amp 240 volt cord with a built in GFCI. The cord is 10 gauge 3 wire (10/3) yellow safety cord. The GFCI has a test and a manual reset button. The response time of the GFCI is 25 milliseconds (mS)
